

Vaccine Points for Providers

The CDC reports that vaccine administration rates have dropped during the COVID-19 Pandemic, which makes unvaccinated or under-vaccinated patients/members at risk for preventable illness and increases risk of community outbreaks.

Administration of vaccines is an essential medical service and should be continued during the COVID-19 Pandemic.

As communities open up, preventable illnesses may spread because patients/members have not received the vaccines that they require.

Maintaining or reinitiating immunization services protects patients/members and communities from outbreaks of preventable illnesses and will reduce the burden on our healthcare system and healthcare providers, which is especially vital during the upcoming influenza season.

It is important to catch patients up on vaccines prior to the start of the flu season.

Some patients/members are scared to visit their doctor's office right now. Let your patients know what protocols your office is following to keep everyone safe during the COVID-19 Pandemic, such as offering appointments for routine well visits and vaccines at different times of the day than sick visits.
